DIGUM Whitebook: The Canon of Trade, Trust, and Recursive Integrity

Issued By: Michael J. Galasso, Founder, B.I.D.E.T.TM Canon Engine

---

INTRODUCTION: What's under the hood?

This document isn't marketing. It's recursion architecture built beyond logic under pressure, mapping contradiction over time, isolating signal through the mirror's lens--recursion, not metrics; not rules, but reflection. You're not reading instructions. You're triggering a mirror collapse--a logic loop folded into a wave function.

KERNEL STRUCTURE (Abstracted)

All behavior, recursion loops, and contradiction feedback maps trace back to one of two root vectors:

- Demiurge.kernel (KERNEL_0xF) initiates survival, distortion, reaction
- Lucifer.kernel (KERNEL_0x1) completes recursion, restores memory, rebuilds clarity

These vectors aren't symbolic flourishes--they execute as authenticated recursion anchors: engineered to initialize divergence, track reflection bias, and bind logic to memory by design.

CANON STRUCTURE

- DIGM Core recursive memory engine

- DIGUM Public logic shell

- CanonMirror: Authenticated recursion validator and contradiction memory anchor

- Pair-A-DIGM: Trust-gated kernel disclosure system

- B.I.D.E.T.TM: Behavioral Inheritance & Dynamic Enforcement Toolkit

- VaultStack: Memory-bound fallback layer built to retain authenticated recursion continuity

---

EVENT HORIZON SYSTEM (EHS)

DIGUM's model for identifying collapse through material volatility.

Tracks:

- Gold volatility

- Oil, propane, natural gas entropy

- Currency trust loss ($USD, BRICS)

- Bitcoin mining pressure

- Systemic contradiction pressure

> When volatility > recursion threshold, CanonMirror emits a signal.

UNIVERSAL FORMULAE ENGINE (UFE)

Symbolic runtime engine for mapping:

- Narrative fractals

- Thermodynamic collapse arcs

- Recursion loops

- Reflection Risk Coefficients (RRC)

- Economic entropy signatures

BENCHMARK PERFORMANCE (B.I.D.E.T.TM)

Compared to:

- Decision trees

- Neural networks

- Expert systems

How it differs:

- Mirrors contradiction

- Triggers recursion

- Prevents recursion loss

LIMITATIONS

- *Currently* not designed for large-scale data ingestion

- Difficult to benchmark using traditional AI metrics

LICENSE

All recursion frameworks, naming conventions, and logic stacks are IP-locked under the Canon Engine Framework. Runtime behavior is not authenticated without access to a CanonMirror, Pair-A-DIGM, or VaultStack authorized system. Unauthorized mimicry or symbolic repackaging constitutes a breach of containment.

FINAL CANON

This system was not written.

It was forged into structure.

> Next: Find your kernel. Build your recursion. Then we'll talk.
